

Beep Card Application Redesign Concept

Beep is a cashless card used for transportation payments for LRT, MRT, P2P buses, and some PUVs in Metro Manila. The Beep mobile application has new features such as real-time checking of the card balance, reward points that can be converted into a load, points conversion into a QR ticket, and a direct load top-up.

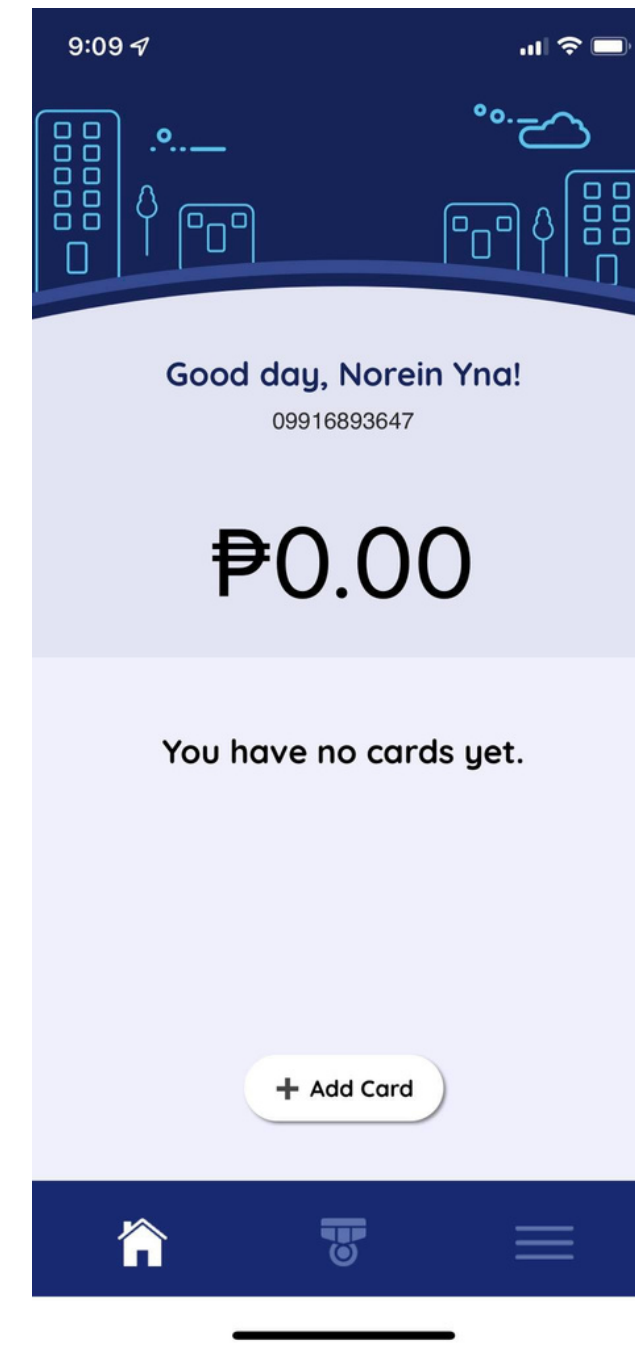

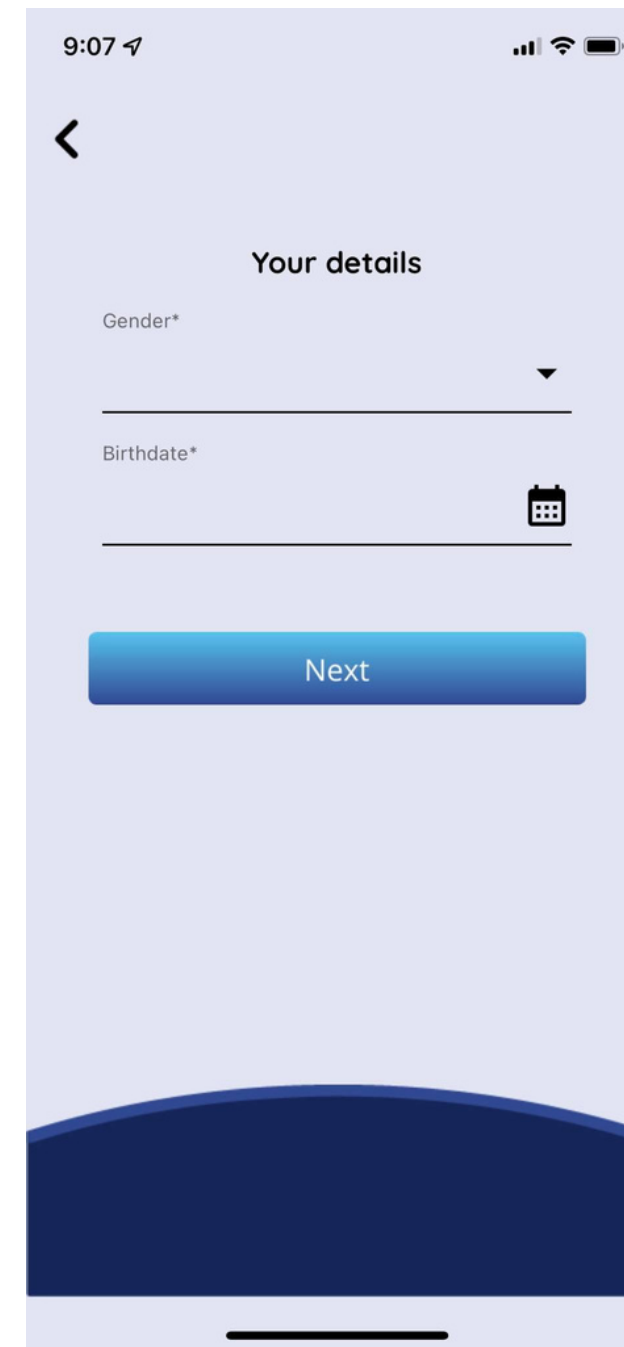

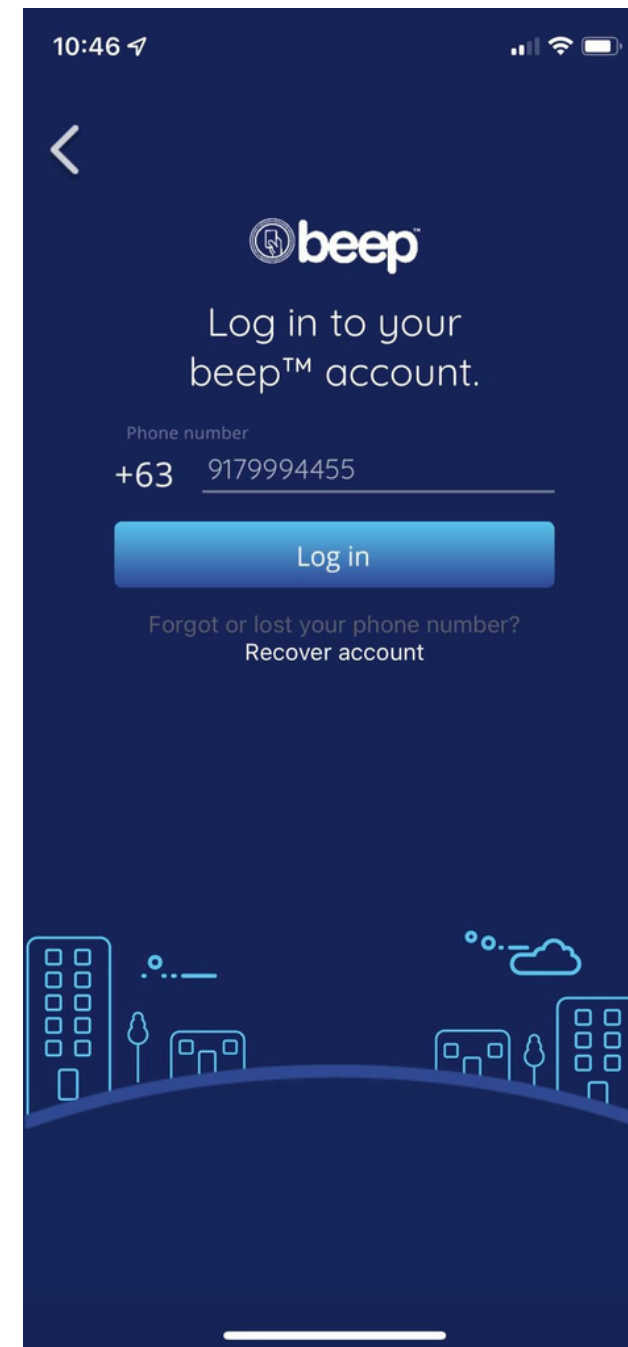

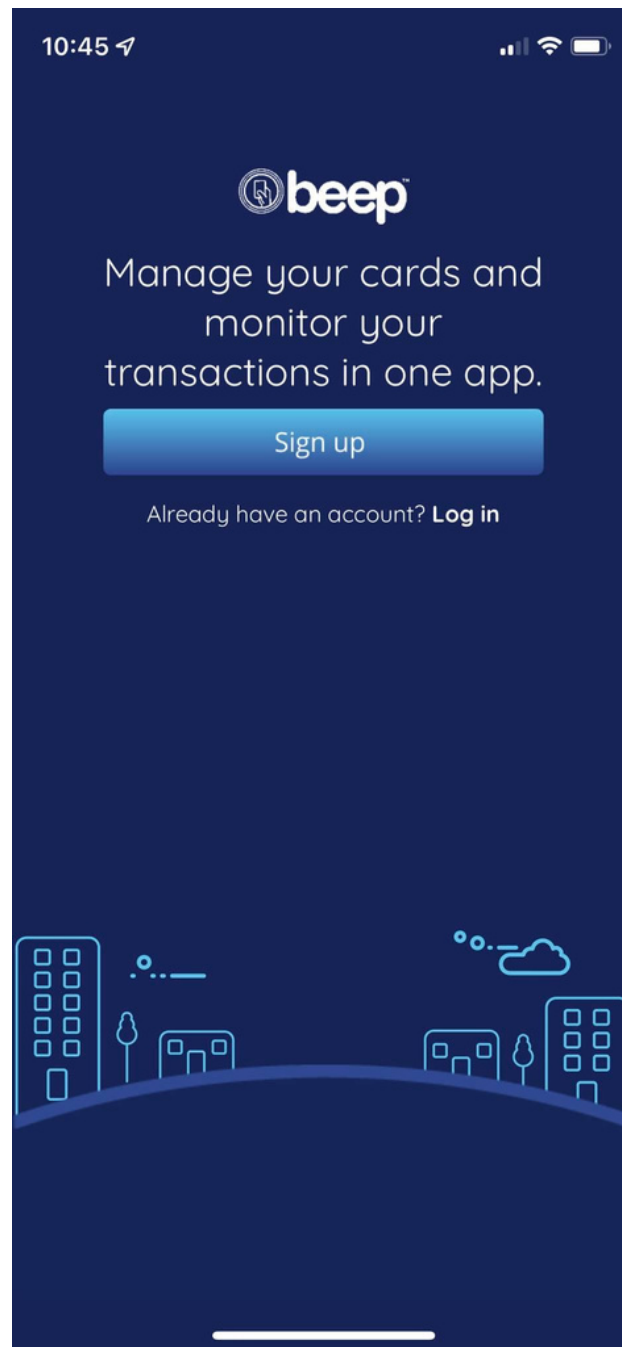

However, some user interface designs on the sign-up screen, dashboard, and hamburger menu may affect the user experience. In line with this, this concept made a few of its processes easier for users to access the application's features. Placing necessary elements on a single screen would make such a difference to their users rather than having multiple pages for all its process.

Redesigned Concept

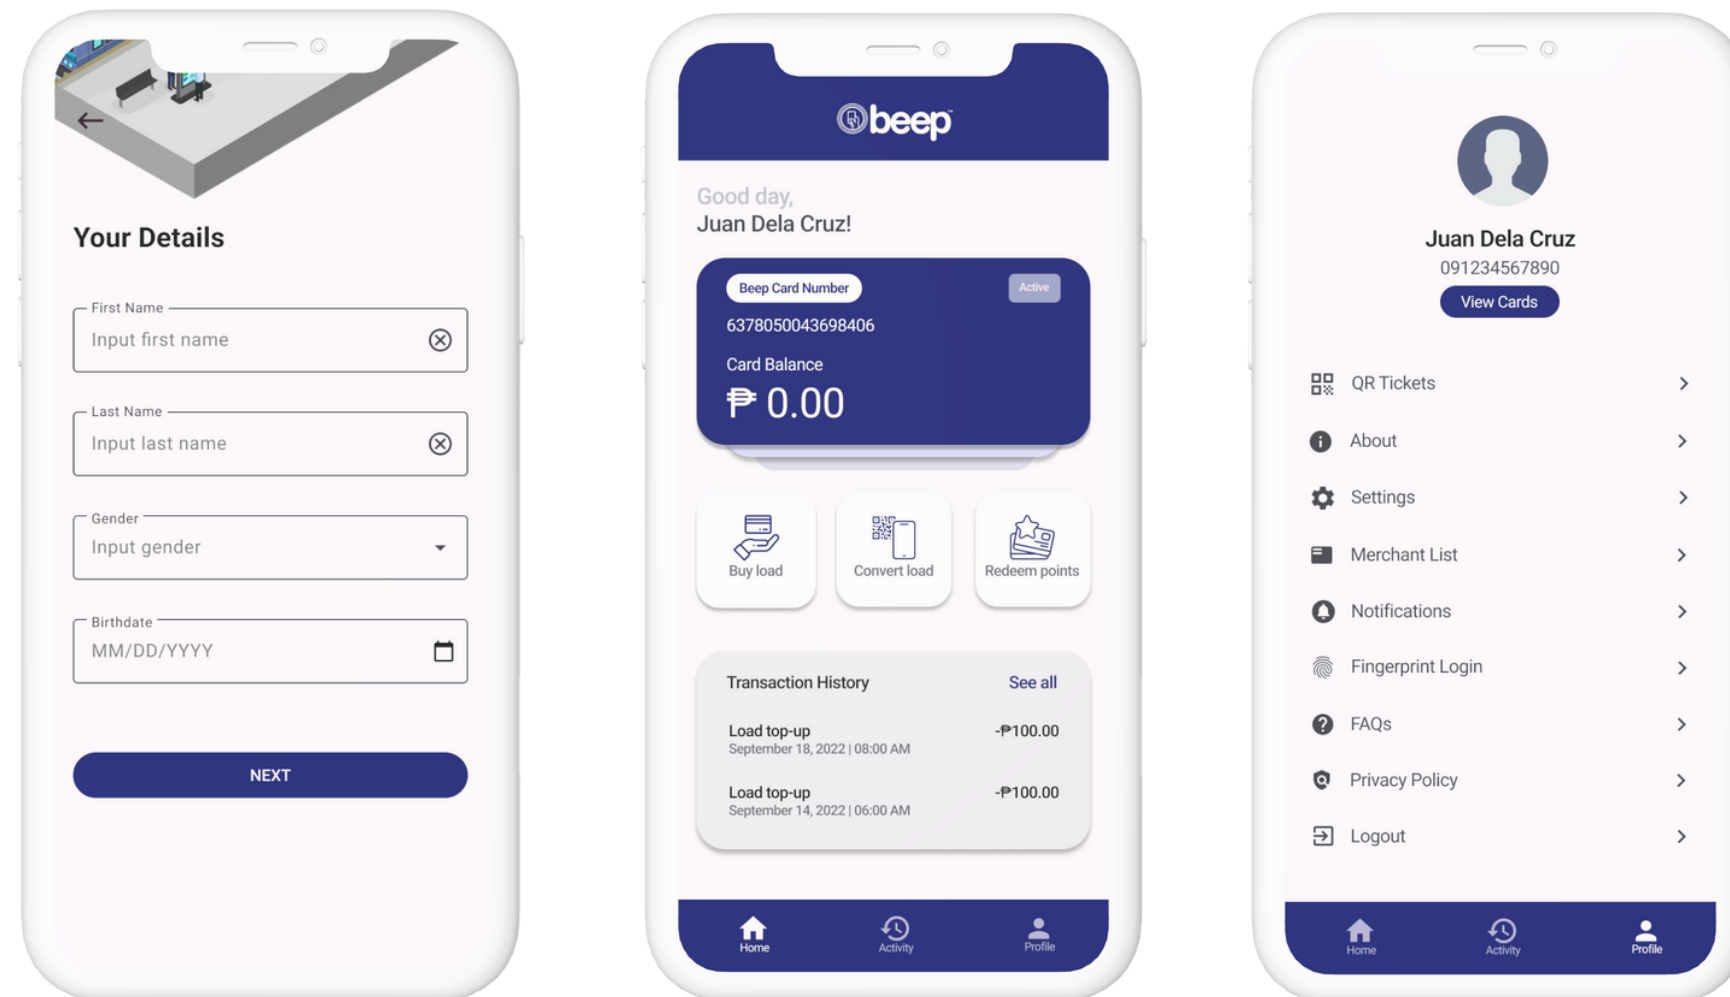

beep™

Redesigned Concept

Redesigned Concept

Redesigned

Made it a one page sign up screen.

Dashboard shows all its other features rather than showing only the user's cards and the balance.

Shows a preview of transactions

Changed the hamburger menu icon into a profile page which include app's settings.

Current

Multiple screens for user registration page.

Dashboard only shows user's cards and balance.

The load top-up will be seen on the hamburger menu together with the other app's settings.
